Alm 19028 CLEVELAND. 5 ONTARIO ST. ESTABLISHED 1839

REMARKS TO PURCHASERS

CATALOGUE, to meet the requirements for which it is designed, should, in our opinion, be a simple, unbiased statement of facts, without exaggeration or glowing descriptions. We have endeavored to adhere strictly to this principle and can truthfully say, that our descriptions are as nearly true as we can make them. It is generally known that some varieties of one kind of seed prove more satisfactory in one section than another, and where any preference has been shown, it has been in favor of varieties known and raised in this locality.

The cost of seed is a small item compared with the value of a successful crop. Nothing for which money is expended brings so large a return, if the seeds are of first quality; AND NOTHING CAUSES GREATER VEXATION THAN WORTHLESS SEED. Therefore it is of the utmost importance that great care should be used in making selections, and orders should be placed only with seedsmen of known experience.

We do not send out agents or peddlers, nor do we supply seeds to be sold on commission. Much disappointment may be avoided by refusing to buy the ordinary cheap seed sent out on commission.

If you have no use for seeds, you will confer a favor by handing this Catalogue to some neighbor who may wish to make selections from it.

OUR TERMS ARE NET CASH.

OUR PRICES—We shall adhere as closely as possible to the prices quoted in this Catalogue, but the market value of some seeds is variable. This is most noticeable in grass, clover and field seeds, onion setts and seed potatoes. Quotations for such articles will be furnished on application.

ORDERS, to secure prompt attention, should be accompanied with remittance, or satisfactory references.

REMITTANCES may be made at our risk by draft, money order, cash by express, express money order, or in registered letter, or, in sums of two dollars or less, by ordinary mail. Postage stamps may be sent for amounts less than one dollar.

SEEDS BY MAIL—Seeds can be sent to any part of the United States at the rate of 8 CENTS PER POUND. Customers desiring their seeds sent by mail will therefore please add to catalogue price sufficient to pay postage at that rate. Peas, Beans, etc., postage will be 15 CENTS PER QUART; Corn, 10 CENTS PER QUART. The ounce and the packet will be sent postage free. PARTICULAR ATTENTION is invited to this, for when omitted the cost of postage will be deducted.

ADDRESS, ETC.—In ordering, please be particular to sign your NAME, also that of your POSTOFFICE, COUNTY and STATE plainly; also mention the mode of conveyance you prefer—whether by mail, express or freight. Serious delays are sometimes occasioned by failing to give attention to these matters.

BAGS ARE FURNISHED AT THE FOLLOWING RATES: Quarter bushel, 5 cents; half bushel, 8 cents; one bushel, 10 cents; two bushels, 15 cents each. In remitting for orders, please add a sum to cover the cost of the necessary bags.

WARRANTS.—We would repeat our remarks of former years, and assure our friends that no pains have been spared to have all our seeds of the very best quality and purity. At the same time we wish it distinctly understood that we do not warrant the same to produce any particular result. Owing to the fact that the ultimate success of a crop depends upon so many contingencies, we cannot hold ourselves responsible for failure; still, having tested our entire stock as to the germinating power, we do not hesitate to recommend it with full confidence, but if possibly any seed should prove really deficient in this respect, we will consider it only justice to replace it to the extent of its cost. **REMEMBER POSTAGE.**

Few years ago our attention was drawn to a distinct Celery growing among the large Stalked Golden that had the characteristics of a very desirable sort both for shipping and for home use.

We sent some of this seed to our growers in Europe and this year we are able to offer a small quantity to our cus-

H New Celery.

... KENDEL'S MAMMOTH LATE CELERY

tomers. This Celery is dwarf, but has a large number of heavy ribs, which are more brittle than the Large Stalked Golden and yet not so brittle as Giant Pascal.

The plant grows very much like the former, and has the color and flavor of the latter.

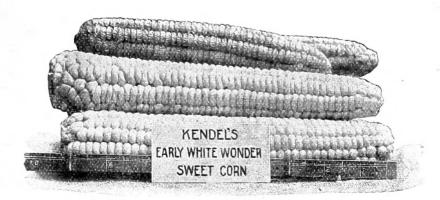

It makes a wonderful growth, one of the plants examined having eleven large ribs after being trimmed for market and a dozen have been reported to weigh twenty-six pounds.

We are confident that it is destined to be one of the most popular and profitable varieties it is possible to have.

PRICE PER SMALL PACKET (2000 SEEDS) 25 CENTS.

PER LARGE PACKET (20,000 SEEDS) \$1.00.

TOWNSEND'S BALL BEARING LAWN MOWERS

WO year's experience with the use and sale of these Mowers convinces us that they are by far the best mowers on the market.

For use on large lawns and where much mowing is done, "The Victory" will last longer without repair than any other mower made, and when repairing through wear or accident is necessary these mowers can be made as good as new at very little expense. The parts that are liable to wear out are small and may be easily replaced.

The Townsend Ball Bearing Lawn Mowers are constructed throughout of the best materials and are as carefully and accurately made as a bicycle. The running parts are of the finest hardened steel and may be easily adjusted to take up the wear.

This is a particular advantage in adjusting the reel, as thus the knives are always parallel to the cutter-bar, and cannot jump away when cutting thick grass.

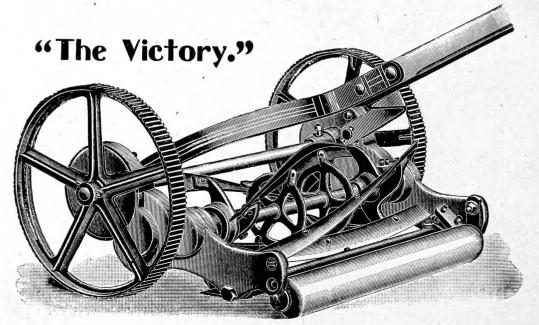

The cutter-bar is tubular, and therefore very rigid. It is easily taken out to be sharpened without disturbing the frame, and may be adjusted to a hair.

The ball bearings make it possible to mow with a machine one-third larger with the same power, which means that a 24-inch ball bearing mower will mow as easily as an 18-inch of other makes.

We have added "The Spider" Ball Bearing to meet the demand of those who want a good mower but have not enough work to do with it to warrant the outlay of a larger and more expensive machine.

"The Spider" is identical in its running parts with "The Victory," only its wheels are made smaller, as it is intended for small lawns.

LAWN GRASS SEED.

HERE is perhaps nothing which so adds to the beauty and attractiveness of the place we call home, as a smooth, fine, well-kept lawn. It is like the setting of a fine gem. It ought not to be a difficult matter to convince our customers of this, when so many fine lawns greet us on every hand.

We wish it were as easy to convince them that we have made it our business to create the want and supply the demand for a strictly high grade article in Lawn Grass Seed, which we have done for many years.

There is much deception practiced in mixing and selling seeds for lawns, but we can truthfully say that we spare no pains or expense, to secure the best and cleanest grasses adapted to our soil and climate, that it is possible to procure and we may add, that we attribute the success of our Extra Mixed Lawn Grass Seed largely to the purity of the seeds we use, as well as the proper proportions in which we mix the different kinds together.

As with almost every article of merit, substitutions are offered for our Lawn Seed. We therefore caution our customers to buy their seeds at headquarters, and save themselves from disappointment caused by having grading-contractors and gardeners sow seed of an inferior grade at a less price than the best, after a greater or less outlay of money and labor. If this picture "A really fine Lawn," is on the label it is genuine.

In order to obtain A REALLY FINE LAWN,..... there are several requisites—a good depth of rich soil, properly drained; a very heavy dressing of thoroughly decayed manure or PURE BONE DUST; nicety of grading in levels sites. and slopes; a firm and smooth surface upon which to sow the seed, and a SUFFICIENT QUANTITY OF THE VERY BEST LAWN GRASS SEED SUITED TO THE SITUATION. The latter item is of prime importance.

LAWN GRASS SEED .- Continued.

A rich soil of good depth and liberally fertilized will maintain a fine green sward many years, provided a small quantity of seed is sown and raked in when the grass begins

Manure

Bone Dust. We have found Pure Raw Bone Dust, of which we have the best grade to be had, the best and safest fertilizer for general purposes. It is clean, easily applied, effective and odorless. It is cheaper than manure, as twenty-five pounds of Bone Dust is equal in fertilizing qualities to a wagon load of manure, and in addition, does not require an extra man to spread it on. For a new lawn or garden, use at the rate of 1,000 lbs. to the acre or about one pound for every five by ten feet of surface; for an old lawn use one pound for every ten by ten feet.

Make a smooth surface with harrow and rake, and use a roller to make it firm and even BEFORE SOWING THE SEED. After sowing, cover the seed well, by raking it

How. in, and again use the roller to finish the work. Use five bushels, or even more, of the best lawn seed per acre, or about one quart for every ten by fifteen feet of surface. In this latitude there is no season more favorable for sowing than the last of August or first of September. Sown at this time the grass will be strong enough to winter over safely; and the weeds which will inevitably appear, will not have time to mature and scatter their seed, being mostly annual plants. It is usually then necessary to

When. scatter a little seed on the lawn in the spring to fill in the bare spots, where the grass has been winter-killed. If the seeding must be done in the spring it should be done as early as possible, so that the young grass may be strong enough to withstand the heat of midsummer. It may be sown soon after the 1st of April, or as soon as the ground is dry enough to rake without lumping, and if sown before the middle of May, it will produce a beautiful lawn by July.

In consequence of the frequent cutting required, the grasses have no time to mature seed for re-seeding the ground; therefore, in order to keep the lawn well stocked with

Re-Seeding. the proper varieties of grass, and not allow noxious weeds and wild grass to gain the ascendency, there should be a sowing of seed made every spring, together with a liberal dressing of bone dust, and a good raking given to loosen the surface and incorporate the fresh sown seed with the soil.

If the above directions are carefully followed, and the weather is right a fine lawn may be expected.

If the weeds become too numerous to pull or cut out, sow a quantity of white clover rather thickly, and the weeds will disappear soon after the clover gets well established.

Look for the Picture "A REALLY FINE LAWN," on the Label.

"SHADY NOOK" LAWN GRASS SEED.

After a series of experiments extending over several years we have been able finally to combine several grasses that we have found will make a good sod under trees and in shaded places. We offer this mixture as "Shady Nook" Lawn Grass Seed and are sure it will fill a long felt want.

It should be sown at the rate of one pound for a space 15x20 feet square. For further directions see above under the word "How."

VEGETABLE SEEDS.

In ordering seeds to be sent by mail please do not forget to read "SEEDS BY MAIL" on the cover page.

ARTICHOKE.—Artichoke.

Sow the seed in April and May, and when large enough, transplant into rows 3 to 4 feet apart and 2 feet in the rows. When cold weather sets in tie the leaves together, so the plants will occupy less space and bank the earth to the top, and in the spring fork in a dressing of manure. They reach maturity the second year, and require deep, rich, sandy loam with plenty of manure. If they are to be treated as annuals the seed should be sown in February in a hot-bed, and transplanted in May. The heads should be cut off before the flowers expand, as after that they are unfit for cooking, and if they are allowed to ripen, the plant becomes exhausted and will produce no more that season. The bulbs of the Jerusalem Artichoke are used extensively as feed for swine and make also a palatable vegetable, being prepared like salsify, and are also used for pickles. The tops may be cut and cured and used as dry fodder.

The saisity, and are also used for presides. The top's may be cut and cured and as	Ju us	ary	rodac

Dwarf Improved French,

CABBAGE. - Kopf-Kohl.

The cabbage crop is one of the first importance to vegetable growers, and to be successfully grown, needs great care and sound judgment, both as to the selection of proper seed and the cultivation through-The early, medium and later sorts all thrive upon similar soils, yet need varying treatment. It is

safe to select either a piece of strong sward-land, or if more convenient, land that has not borne crops of cabbage or turnips for two or three years previously. Sward-land should be plowed in the fall and again cross-plowed in early spring after a heavy dressing of strong manure; high cultivation is absolutely necessary. In this vicinity the larger portion of the early varieties are grown from seed sown in hot-beds in February and March, only moderate bottom-heat being required. Transplant into other frames without much if any bottom heat, as soon as the plants show the fourth leaf, setting them low in the earth to make them stocky. In April, or as soon as the ground can easily be worked, set out in rows three feet apart and about eighteen inches between the plants. The smaller varieties may be grown a little closer. The ground should be thoroughly stirred with a cultivator, and hoed every week till

Early Winningstadt Cabbage. Early Winningstadt Cabbage. the plants cover the ground. Cold-frame plants are often used for early planting; such plants are obtained by sowing the seed about the middle of September, and later transplanting into cold frames, where they are wintered over. These plants are desirable on account of their hardiness, and are less liable to become stunted when set in the open ground. In some localities a crop of celery is made to follow early cabbage the same season, by setting every third row with celery plants. (See remarks on celery culture.) For a fall crop sow in the open ground in May, and transplant in June and early July.

Carrots are grown for feeding to stock, as well as for culinary purposes; there is usually a market demand for considerable quantities for cooking, many of the earlier sorts being sold in bunches when about

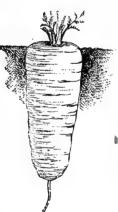

half grown. A rather light, sandy loam, deeply tilled, is best suited to the growth of carrots, and upon such soil, if it has been liberally fertilized the previous year, a good crop may be grown without much, if any, additional manure. Strong, fresh manure should never be used. Make the surface smooth, and sow in drills about fourteen inches apart, and about half an inch deep, thinning the plants when large enough, so as to stand about three or four inches apart. April or May is the proper time to sow, varying the time according as an early or late crop is wanted. Good crops have been grown from sowings as late as the 10th of June. Early weeding is very important. Sowing a little radish seed with carrot, just enough to show the row often saves a crop.

Early Scarlet Horn. A medium-sized Pkt. Oz. 1/4 lb. Lb. root, half-long, stump-rooted, of fine color, and much used for cooking; grown for early use, and to sell in bunches; bears close planting..... \$ 05 \$ 10 \$ 30 \$100

CAULIFLOWER. - (Blumen Kohl.)

The growing of cauliflower is receiving more attention than formerly; particularly so the earlier varieties. The crops of Snowball and Dwarf Erfurt begin to come forward in June, and these, with the later sorts, are in the market, almost without intermission, until November.

high cultivation and pienty of moisture, even

Lenormand's Short Stem Cauliflower.

more so than cabbage. Whether grown in the kitchen garden or upon a large scale, the crop is a paying one, and there is not a more delicious vegetable grown. The demand is evidently increasing. Cold-frame plants are probably the best and hardiest for early crops; the frames. however, need rather more protection during cold nights than is required for cabbage plants. Seed sown in hot-beds in February will produce plants that are not much, if any, inferior to cold frame plants. They should be transplanted once before setting in the open ground, and also should be gradually hardened by exposure; in this way they will be in condition to set out as early in April as the ground will permit. Set the early sorts about two feet by fifteen inches, and cultivate the same as cabbage. When irrigation is practicable, great advantage is obtained during a drought For late cauliflower, sow seed in open ground, from the middle of May to the middle of June, and transplant the same as cabbage. When plants first appear they are liable to the attacks of a small black fly; guard against this fly by frequent dustings with plaster, which apply in the morning while the dew is on. When the

heads are forming, tie the leaves together at the top, thus avoiding discoloration by exposure to the sun. The crop of cauliflower depends entirely upon the state of the weather during the time of heading. If it is hot and dry, the heads will be inferior in size, solidity and color; if moist and cool, the same plants would produce beautiful, white, solid heads. For this reason it is deemed advisable to use three or four varieties every season, which may be sown and transplanted all at the same time; but as their season for heading differs, some of them are certain to come in when the weather is favorable. All the different varieties we offer are sure to head. If any plant should fail to head in time, if taken up before freezing and planted in a cellar, a head corresponding to the strength of the plant will be almost a certain result.

In comparing our prices on Cauliflower please bear in mind that all the stocks we offer are absolutely the best selected strains to be had. In placing our orders in Europe we always insist on the purest, most reliable and satisfactory grades grown, and though the additional cost is considerable, it is but slight when compared with a good and poor crop of cauliflower.

Late heading variety.....

But little celery is grown for early use, as it is not in its most palatable condition until about October, the bulk of the crop being used during November and later. For this reason it is generally grown

as a second crop, following early cabbage, onions, peas, etc. If it is desired to start the seed early in hot-beds, great care must be taken to shade it from the sun immediately on sowing, as one hour's sun-shine through the glass upon the seed so lightly covered, will destroy its vitality, and cause great disappointment. The proper time to sow in the open ground is early in April, transplanting about the first of July. The seed being very small, should be covered very lightly, and the earth pressed firmly down upon it. Some gardeners trim off the top a little, while the plants are small, to make them more stocky. Set in rows three or four feet apart, and about six inches between plants in the row. Keep down all weeds, and as fall approaches, draw earth up to the plants, keeping the stalks well together. This earthing-up is continued at intervals, until only the leaves appear above the soil. When well blanched, it is ready for use. For winter use it is usually placed in tenches, and covered with earth and litter or stored in soil collections. and litter, or stored in cool cellars.

CORN; Sweet or Sugar.—(Zucker Mais.)

All are so familiar with corn, it is unnecessary to describe its appearance or uses. Its cultivation is very simple, and with only ordinary care good crops are grown. Plant in any good soil, in rows three to four feet apart, according as a dwarf or tall-growing variety is planted. Nothing grown in a garden gives more satisfaction for family use than sweet corn, providing there is room for its proper culture. The usual mode of planting is in hills, leaving three or four stalks in a hill, but it has been found to be a much better way to plant in straight rows, three or four feet apart, and one stalk every foot. This will give each plant an equal chance, and every stalk will bear one or more ears. It is advisable to plant three or four varieties, so that one kind may follow the other in regular succession. If not acquainted with the different varieties the selection might be left to us.

CUCUMBER.—(Gurke.)

To obtain early cucumbers and at the same time avoid most of the annoyance of the striped bug, it is a good plan to plant the seed about the first of May in frames without much bottom heat. Small pots may be plunged into the soil, in frames, and a few seeds planted in each; or small sods, turned over, may be placed close together in the frames and a few seeds placed in each. In three or four weeks these may be transplanted into open ground, each piece of sod being set into hills three or four feet apart each way. If transplanted in the evening and one watering given, the plants will not droop. The seeds may be planted in the hills late in May, making the crop somewhat later. Use dry plaster, or an infusion of powdered white hellebore in water, to destroy the striped bug. For pickles plant during the last two weeks in June.

KALE or BORECOLE.—(Blaetter oder Krausskohl.)

Sow early in May, in a prepared bed, and transplant in June, setting the plants and cultivating in the same manner as cabbage. A strong soil, well manured, is required. The many varieties of Borecole are all most delicious—more delicate in

Dwarf Curled Extra Fine Pkt. Oz. 1/4 lb. Lb.

flavor than cabbage, the quality being improved

German. Is a hardy green, nicely curled, dwarf-growing variety, and is the sort most generally sown. If the seed is sown in the spring, and the plants well thinned out, they

after a light frost.

Extra Fine Dwarf German Kale.

KOHLRABI.—Kohlrabi.

Sow in May or June, in rows about eighteen inches apart, and thin out the plants to about twelve inches in a row. Ordinary soil with a moderate amount of fertilizing is all that is required to grow Kohlrabi. This vegetable appears to be intermediate between turnip and cabbage, and has to a certain extent the flavor of both. The bulb that forms upon the stem, just above the ground, is fit to use when about half grown; when mature, it becomes hard and fibrous. It is boiled and served like turnips.

LETTUCE.—(Lattich Salat.)

Lettuce is a plant of most simple culture when grown in the open air. It requires rich soil, plenty of well-rotted manure and abundant moisture. With these conditions its growth is vigorous and rapid;

and to be crisp and tender, it should be grown quickly. Of all the salad plants, lettuce easily takes the lead, and no garden is worthy the name without its lettuce-bed. It has few, if any, insect enemies, and flourishes throughout the spring and summer months. Drouth and hot weather are its principal drawbacks, as during such periods it inclines to run to seed. Seed may be sown in February and March, not much bottom heat being required. The plants may be set out as early as the ground can be worked, as light frosts will not injure them. Set in rows, about eighteen inches apart, leaving eight or ten inches space between the plants.

MELON—WATERMELON.—(Wassermelone.)

Melons of all sorts should be planted on rather a light sandy loam, a gentle slope toward the south being desirable. Make hills about eight feet apart each way, and put in each a good shovelful of well composted manure, press it down and cover

with earth. Upon each hill plant six or eight seeds about half an inch deep. The middle of May is early enough for planting in open ground, but the crop may be forwarded by planting in frames, as directed for cucumbers. Three plants should be left to grow in each hill. Destroy bugs and cultivate in Upon each hill plant six or eight seeds an inch deep. The middle of May is same manner as for cucumbers.

30 10

MUSHROOM SPAWN.

The true mushroom, and the variety cultivated for market, grows naturally in pastures only, from whence it is taken in the form of spawn, an article of commerce, price of which will be found below. It never grows in boggy places nor in woods, nor about the stumps of trees. It is never greater than five inches in diameter, and seldom more than four; is pale brown in color, externally, and dry. The cap is fleshy, firm and white within, never thin and watery, and has a frill about the edge. The gills are first white, then fleshcolored and finally, when the mushroom is full grown, become brown-black, at which time the mushroom drops spores, corresponding to the seeds of other plants, which are brown-black or deep purple-black in color; the gills grow entirely free from the stem. The stem is solid and slightly pithy up the center, but never hollow, and is supplied with a prominent ring near its middle. The cuticle readily peels away from the flesh beneath, which upon being cut or broken remains white, or nearly so. The odor of true mushrooms is not offensive, but on the contrary quite pleasant. Another edible variety growing in pastures is light brown in color; gills white; ring movable, and cap covered with small scales, made by the breaking up of the cuticle. Called umbrella mushroom. Still another grows in thin forests, is orange or bright red, shaded to yellow; gills and stem yellow, stem tapering upward and sometimes hollow, and growing out of a white volva, from which it comes free. Called orange mushroom. There are a number of other edible varieties, but their eating qualities had better be left to the judgement of an expert.

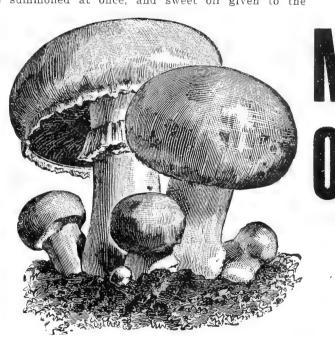

Mushrooms should be fresh when used, and if they each have ALL the characteristics given, no fear of poisoning need be entertained. In case of poisoning, the symptoms of which are nausea, drowsiness, stupor and pains in the joints, the doctor should be summoned at once, and sweet oil given to the patient to allay corrosive irritation of the throat

and stomach.

The culture of Mushrooms is becoming a large and lucrative business. The locations for producing them are so numerous that almost anyone can, with a little care and trouble, successfully raise mush-rooms for market, and thus add considerably to the proceeds of the garden or green-house. Under the green-house benches, in cellars, old hot-beds and under bank barns, the conditions are usually the most favorable, the principal essentials being rich soil and an even temperature, ranging from 50 degrees to 80 degrees Fahr. Fresh horse manure left in a heap until the high temperature is reduced, well mixed with one-fourth its bulk of good garden soil, and packed to a depth of twelve inches, will make a suitable bed in which to plant the spawn. If the temperature is higher than 78 degrees Fahr., it is best to wait with the planting until the bed has cooled off sufficiently. It is advisable to expose the dry spawn to a moderate moisture for a few days, to insure a safer and more rapid growth. Break the spawn into pieces the size of a black walnut, and plant six inches apart. After twelve days cover the bed with an inch or two of soil made fine, and water with luke-warm water when the beds become a little The mushrooms appear in the course of six to eight weeks.

The yield may be prolonged by watering with

liquid manure, and adding a little salt or saltpetre occasionally.

Mushrooms.

OKRA, or GUMBO.—(Essbarer Hibiscus.)

Sown in June, in drills-the dwarf variety about two feet apart, the tall sort three feet, and one inch deep. Thin out the plants to from eighteen to twenty-four inches, according to variety.

ONION.—(Zwiebel.)

The onion crop is perhaps next in importance to cabbage. Although an expensive vegetable to cultivate, it is usually a very profitable crop. Much depends upon the selection and preparation of the

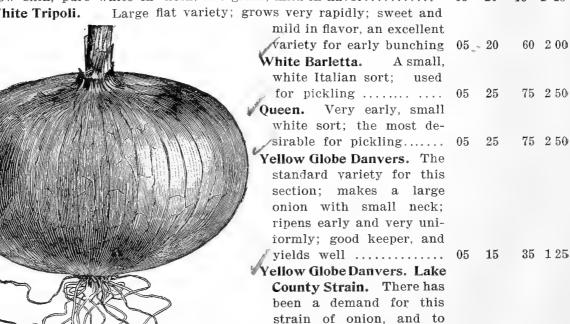

ground, the quality of the seed, the quantity and value of the fertilizers, the time of sowing, and the care bestowed upon the growing crop. Much also depends upon the season. A long, cold rain after sowing often causes failure of the seed to germinate well; or severe drought in early summer may cause the crop to blight. Nevertheless, success is the rule, and with proper care, a crop of from four to five hundred or more bushels per acre may be reasonably expected. Select, if possible, a clean, rich piece of land, upon which onions were grown the previous year. In some localities onions have been grown for over thirty consecutive years upon the same land, while in other sections it is found safer not to continue to grow them more than three or four years in succession. A crop of carrots is the best to precede onions. Scatter broadcast a heavy dressing of well rotted manure, and plow six or seven inches deep as early in the spring as the ground can be worked; harrow and rake down to a fine, even surface. Sow

Giant White Tripoli Onion.

four or five pounds of seed per acre in drills fourteen to fifteen inches apart, and a quarter of an inch deep. If a seed drill is used, it should be provided with a good roller to press the earth upon the seed. particularly if the earth is very dry. Sow as early as possible; a few days delay often makes a marked difference in the crop. Unless the plants stand very thick together, they need not be thinned out very much, if any, as onions will crowd each other and find room to grow. NEVER ALLOW THE WEEDS TO GET AHEAD OF THE YOUNG PLANTS; the weeds must receive early attention. Use a scuffle or wheel hoe between the rows, and pull out the weeds not reached by the hoe. When the tops are all down and the onions well formed, they may be pulled and left on the ground to dry, unless the weather be unfavorable. It is well known that our onion seed is the very best that can be obtained anywhere, and will give the best possible results in this climate.

in common use for general crop..... Fine Moss=Curled. A most elegant curled variety; rather dwarf, and of the richest green; very ornamental

Hamburg, Large Rooted. A rooted variety, the roots of which are used in winter; good in flavoring soups or stews; it can be kept all winter in the cellar, covered with sand.....

PARSNIP.—(Pastinak.)

Sow in April or early in May, as parsnips require long seasons to mature. After the ground has been deeply tilled and made fine, the seed should be sown in drills twelve to fifteen inches apart and half an inch deep,

and thinned out so that the roots will not crowd each other. Hoe and cultivate deeply, to keep down the weeds. Parsnips, besides being used to a large extent as a winter vegetable, make also an excellent root upon which to fatten cattle and swine, there being sections of the country where it is the only root used for that purpose. They may be dug in the autumn and stored for winter; but if left in the ground till the following spring, they are very much improved in flavor. Sow a Miberal quantity of seed, as from its nature it does not always come well.

The variety most in use and best adapted to Pkt. Oz. 1/4 lb. Lb. Sugar or Hollow Crown.

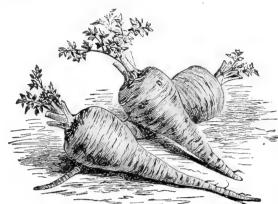

Plant them as early in spring as convenient, to obtain early green onions, but they may be set any time up to June 1st. Set in rows a foot apart and three or four inches between them in the row.

White Bottom Setts. Good for general use; mild flavor.....

Yellow Bottom Setts. Not as mild in flavor as the white variety, otherwise as good,

Potato Onion Setts. Sometimes called "Hill Onions" or "Multipliers."

Prices Variable.

Hamburg Large-Rooted Parsley.

PARSLEY.—(Petersilie.)

Parsley seed very slowly, taking two to

four weeks to come up; hence, if wanted early, sow as early as possible. Make the rows twelve to fourteen inches apart. Thin out to three or four inches or transplant to that distance. Can be sown in hot-beds in February, or later in open ground. Later in autumn place frames over some of the plants to lengthen out the season of cutting. For garnishing purposes nothing equals parsley; it is also used in salads.

PEAS. - (Erbsen.)

No one who plants a vegetable garden thinks of doing so without peas, and they are relied upon by almost every market gardener, as they bring early and usually very profitable returns, besides permitting the land to be occupied by a second crop. Celery, squash, melons, sweet corn, and various other crops, may be grown after peas. The curtivation of peas requires only ordinary care, but we would call particular attention to the fact that success depends in a great measure upon the quality of the seed; and as a rule, the gardener who thinks it economy to purchase peas where he can obtain them at the lowest figure finds that he has made an expensive mistake when he gathers his crop. The dwarf varieties require a rich soil, and liberal manuring; the other sorts need only ordinary cultivation. Peas are very hardy and succeed best under low temperature. The early, round smooth varieties should be sown as early as possible in the spring, while the more tender, wrinkled sorts do better if planted after the ground has become warmer. Sow in drills two or three feet apart, according to the height of the variety planted, and not less than 4 inches deep. A pint will plant a row of forty feet. Make the furrows deep enough to allow room for the manure, which is usually scattered along the bottom. It is safer not to have the seed in direct contact with the manure. Successive plantings need not be made, several varieties which naturally succeed each other in their time for ripening may be planted at the same time, in this way securing a constant succession of this choice vegetable. If desired, dwarf varieties, which require no brushing can be released

No Peas will be sold at less than 50c for 4 quarts unless noted.

Extra Early Varieties.

Kendel's First of All. This Pea is the result of many years' careful selection. It leads the list of extra earlies for earliness, productiveness, size of pod and quality of flavor. It is uniform in growth and ripening, and free from rogues or runners to a marked degree. Our best gardeners prefer it to any other of this class.

SEED SWEET POTATOES.

Early in May make a hot-bed in the usual way, using only one and a half or two feet of manure covered with about one inch of sandy soil; let the beds stand a week or more, until the first heat has passed off, then plant the potatoes closely, almost touching each other—about one-half bushel to a bed four by six feet; cover with one inch of sandy soil, and when the plants begin to raise the ground, gently put on two inches more of sandy soil. When there are no more frosts, and plants are large enough, strew rows of manure four feet apart on unplowed ground and plow one furrow from each side on to the row of manure, leaving the strip under the manure unplowed. Plant the sweet potato plants upon the ridge thus formed, fourteen to sixteen inches apart; keep the ground free from weeds and occasionally lift the vines to keep them from rooting at the joints.

RADISH.—(Rettig.)

Radish should be grown on light sandy loam, and to be crisp and tender they should make a rapid growth. If the soil is moderately rich, very little, if any, fertilizer is necessary. For very early use,

begin sowing in frames in January, and continue successive sowings every two weeks. Do not sow too early in open ground; by the middle of May is early enough. For such early sowing, a warm, well sheltered situation should be selected; later sowings may follow every two or three weeks throughout the summer, using the varieties best adapted to the different stages of the season.

RHUBARB.—(Rhabarber.)

variety 05 10

Pkt. Oz. 1/4 lb. Lb.

Victoria. The variety in general use for the market; yields immense crops. \$ 05 \$ 20 \$ 60 \$2 00 Large roots of the Victoria variety, 15c each; per dozen, \$1.50; per hundred, \$10.00.

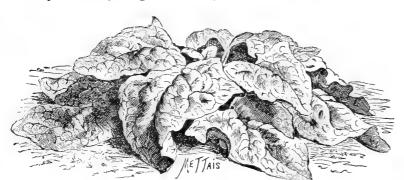

SQUASH.—(Speise Kuerbis.)

Squashes being very tender, should not be planted too early; and, as they make a very rapid growth, they will have ample time to mature if planted after the weather has become settled and warm. A warm, mellow soil suits them best, and they require a liberal amount of manure, which is best applied direct to the hills. Plant in May, after all danger of frost is past. The summer varieties should be planted in hills three or four feet apart each way, and the later sorts about twice this distance. Put eight or ten seeds in each hill, as there is much danger of loss from bugs. Protect against these as directed for cucumber culture. When well grown, tain to three or four plants in each hill.

SPINACH.—(Spinat.)

Spinach may be grown on any ordinary soil, and its cultivation is a simple matter. It is grown

both as a spring and summer crop. For early use sow in August or September, in drills twelve to fourteen inches apart, using ten pounds of seed per acre. At the approach of cold weather cover lightly with straw or any handy litter Uncover when the plants begin to make a new growth in spring. For summer use sow early in spring, in same way as above, using less seed. If the plants stand too thick, thin to three or four inches apart. A liberal dressing of good manure should be used. The land can hardly be made too rich.

Extra Large Round	Thick-Leaf Spinach.

SALSIFY, or Vegetable Oyster.—(Haferwurzel.)

Salsify is a most delicious vegetable. When cooked it has an oyster flavor, hence its name, Vegetable Oyster. The cultivation is precisely the same as directed for parsnips. and it will keep over winter in the ground where grown, in the same way as parsnips. There are two colors, white and black rooted. Pkt. Oz. 1/1 lb. Lb. Mammoth Sandwich Island. A large and superior variety, which is used almost exclusively; white-rooted \$ 05 \$ 15 \$ 40 \$1 25 Black=Rooted Scorzonera. 05 15 40 1 50 TOMATO.—(Liebes Apfel.) The seed may be sown in hot-beds, with good bottom heat, in February or March, and when the plants are two or three inches high transplant into other frames about four or five inches apart each way, or into boxes or single pots which are to remain in the frames. Set the plants out in open ground, not earlier than the last week in May or first of June. Being very tender, they will not bear the least frost. Choose a light sandy, gravelly loam, in a well sheltered situation, and with a southern exposure if possible, as early fruit is desirable. In such a location the plants may be set about three feet apart each way, using a large shovelful of well rotted manure in each hill. On rich soils but little, if any manure is necessary. SWEET, POT AND MEDICAL HERBS.

A small space in the garden may be used to good advantage for the cultivation of a few of the most useful and desirable herbs. Their cultivation is very simple, but little care being needed beyond keeping down the weeds. Sow in April or May, in drills twelve to fifteen inches apart, and thin out the young plants where they stand too thick. When the ground is well covered with the foliage it is a good plan to cut out every other row, which tie in bunches and dry in the shade. The balance of the crop, having more room, will spread out and again cover the ground in a short time. In this way a large crop may be taken from a small patch of land. As a rule all herbs should be gathered when just coming into bloom.

BIRD SEED, ETC.

The bird seed we offer is in every case of the best grade, and has all been carefully recleaned. We do not attempt to compete with cheap bird seed, which has been mixed with other seeds to make it cheap, but sell only the best. If your bird has been sick or out of song try our seeds and convince yourself that birds enjoy good, wholesome food as well as you do. We guarantee each package to contain what it is marked, and to be full weight, without the paper or box.

CANADA FIELD PEA.

For the Northern States there is no crop of greater value than Field Peas, nor more neglected, which can only be attributed to a lack of knowledge as to its merits. Whether for fodder, in mixture with oats, sown at the rate of two bushels per acre, or the peas sown alone at the rate of three bushels per acre for plowing under there is no crop that we can so strongly recommend for more extended culture. Like all Leguminous crops, peas have the power of extracting nitrogen from the air, and the soil from which a crop of peas has been harvested is richer in nitrogen than before the peas were sown upon it, and there is no kind of live stock on the farm to which Peas and Oats in mixture can not be fed with positive advantage. Used as feed for pigeons, etc.

Price on Application.

SOUTHERN COW PEA.

Its value as a fertilizing crop exceeds that of clover, for in addition to being a larger Nitrogen gatherer than clover, it draws from the subsoil to the surface large amounts of both Potash and Phosphoric acid, thus putting the soil in most excellent condition for following crops.

The feeding value of Cow Peas, either green fed as hay, or preserved as ensilage is very high, being considerably above that of Red Clover.

The yield of green vines per acre runs ordinarily from five to fifteen tons.

The yield of peas vary according to varieties, conditions of soil, etc., from ten to thirty bushels per acre.

Cow Peas like all other crops thrive best on good ground. The maximum result being obtained from dry sandy loam, but from their strong growth of roots will do well on almost any soil not too wet.

Sow 1½ to 1¾ bushels per acre, on land thoroughly pulverized, and disk or plow with a cultivator or double shovel plow. If wanted for hay, cut when peas are forming, cure as clover. If peas are for fertilizer, sow same quantity after same preparation as for hay, turn under when peas are in bloom. If farmers will first roll and disk peas, they will turn under much easier and be more satisfactory. For a fertilizer, especially to be followed by wheat or corn, they are simply the best. Bear in mind that the Southern Cow Pea belongs to the Bean family, therefor must not be sown until the ground is thoroughly warm and all danger from frost is past. Weight 60 lbs. to bushel.

WHIP POOR WILL.

Speckled or Rattlesnake are the earliest to mature, tall, upright, medium yield of vines, large yield of peas for which they are particularly grown.

Price on Application.

SORGHUM OR SUGAR CANE.

While Sorghum is grown very extensively for the syrup which is extracted from it, yet its chief value lies as a forage plant which is highly relished by horses, cattle and sheep. It possesses the power in a marked degree of sprouting up again after it has been eaten off, hence it provides forage for a much longer period than corn. Sorghum may be grown in much the same way as corn; like corn it would be advisable to sow the seed at intervals in order to prolong the season of pasturage. It is a deep and firm rooted plant and possesses the faculty of growing in dry weather. The readiness with which it springs up when cut off frequently adapts it for soiling purposes, in some sections two to three cuttings can be obtained. If Sorghum cane is wanted for hay, seed can be sown broadcast or in drills, cut when seed is ripe, shock in field and haul in as needed. Do not stack or store in barns, as sorghum will spoil unless the cane is left so the air can freely circulate through. For ensilage, for milch cows, nothing can be better or more profitable. Sow broadcast about one half bushel, in drills, 6 quarts to the acre. Weight, 56 lbs. to bushel.

EARLY ORANGE.

A strong grower and more juicy than the other varieties, the stalk is heavier and a little later than the Amber. Per lb. 12c.

Bushel price on application.

AMBER CANE.

The earliest of all. Per lb. 12c. Bushel price on application.

DWARF ESSEX RAPE.

A forage plant of highest value. It can be sown in April for an early crop, and for fall in July, August and September, and still later further south. It is sown broadcast 6 lbs to the acre, but is better drilled, in which case 3 lbs to the acre will suffice. In a few weeks from the time of sowing, sheep, hogs or cattle can be turned on it; all reports agree that they can gain weight faster on this than any other fodder, as it can be sown after other crops are off; the gain in fodder is secured at a nominal cost. Stockmen, Dairymen and Farmers have proved its value.

Price Variable. Per lb. 15c.

Clover and Grass Seeds.

Terms: Cash with Order.

Two-Bushe Bags, 15 Cents Each.

In regard to grass and Clover seeds we would say we only handle the very best quality, and at all times will be as low in prices as is consistent with a good quality of seed.

Cartage is free, but the purchaser must pay Freight or Express charges. On account of the early publication of this catalogue, we cannot quote prices on Clover and Grass Seeds, as they are subject to frequent variations; but purchasers may depend on having them at the price ruling in store on the day of shipment, and we will always send as much as the money will pay for.

CLOVER SEEDS.

RED CLOVER. (Trifolium Pratense.) This invaluable plant may justly be placed at the head of the list; by its judicious use, land which may have been exhausted by too severe a course of cropping may be brought back to fertility, and fresher and unexhausted fields preserved in undiminshed vigor. It succeeds on any soil of moderate fertility, if sufficiently dry. May be sown in autumn or winter in the south, or in this latitude upon the snow immediately previous to its disappearance, by which the seed is distributed with regularity ,and carried down in the crevises of the soil. A dressing of one bushel of gypsum to the acre will immediately increase the clover crop. From 15 to 20 pounds of good seed is required for an acre, more being necessary on old and stiff soils than on new and lighter ones. Weight, 60 lbs per bushel.

Market Price.

MAMMOTH OR SAPLING CLOVER. This variety grows five or six feet long, and is used almost exclusively for plowing under for fertilizing. Its stalks are so coarse and large that stock will eat only the leaves. Sow in the spring or autumn, at the rate of 10 to 15 pounds per acre. Weight, 60 lbs. per bushel.

Market Price.

ALSYKE, OR SWEDISH CLOVER. (Trifolium Hybridum.) A native of Sweden, perfectly hardy, does not heave in winter or spring from frosts, stands drought well, and is in many respects superior to the common red variety. It affords a large return in hay, is excellent for soiling, and for bees it is unsurpassed. When the plant is once established, it will remain for a great many years in full vigor, and produce annually a great quantity of herbage of excellent quality. It is excellent for sowing on hillsides or sloping lands that are liable to wash or gully, and it has a great mass of long, strong, fibrous roots, which take firm, deep and widespread hold into the soil, and prevent its washing. Sow in spring or fall, about eight or ten pounds per acre. Weight, 60 lbs. per bushel.

Per lb. 15c. Price Variable.

ALFALFA, LUCERN OR CHILIAN CLOVER. (Medicago Sativa.) It is a valuable fodder plant, lasting from 8 to 10 years. The roots penetrate the ground from 10 to 15 feet. It requires a deep, richly manured and well cultivated soil. Sow from 15 to 20 lbs. per acre. Weight, 60 lbs. per bushel.

Market Price.

CRIMSON OR SCARLET CLOVER. (Trifolium Incarnatum.) An annual with crimson flower. Is sown during August, but on account of our severe winters has not proven very satisfactory. It has been sown to some extent, and has made a most beautiful sight when in bloom; we have heard of but few having much success with it as a foliage plant, however. Sow 15 to 20 lbs. to the acre. Weight 60 lbs. per bushel.

Price lb. 10c. Price Variable.

WHITE DUTCH CLOVER. (T. repens.) An excellent pasture grass, forming in conjunction with Kentucky Blue and other grasses, the finest and most nutritious food for sheep and cows. Its flowers are also a favorite resort for the honey bee. It succeeds on all good lands, if not too wet. It takes six to eight pounds per acre. Weight, 60 lbs. per bushel. Choice quality.

Per lb. 40c. Price Variable.

GRASS SEED.

The following are the most valuable of the natural Grasses for agricultural and other purposes. We give a short description of the different varieties, which will be a guide for the selection of seed for permanent pasturing, etc. We strongly recommend our mixtures for lawns, pastures, etc., as being the best and most economical that can be used.

TIMOTHY. (Phleum pratense.) This is the best grass for hay, making a large return on strong, rich clay, of medium state of moisture; though somewhat coarse and hard, especially if allowed to ripen its seed, yet if cut in the blossom or directly after, it is greatly relished by all kinds of stock, and especially so by horses. It grows very rapidly and yields large crops on favorable soil. It cannot be used advantageously as a pasture grass. Sow fifteen to twenty-five pounds to the acre. Weight, 45 lbs. per bushel.

Market Price.

GERMAN, OR GOLDEN MILLET. This variety is not so early as the Common Millet, but yields a much larger crop. Will grow from five to ten feet high; the heads are closely condensed, spikes very numerous; seeds golden yellow, round, in rough bristly sheathes. It is extensively grown, and gives general satisfaction. When in the bloom, or soon after, the stalks are soft and readily eaten by all kinds of stock. Sow thirty-five or forty pounds per acre. Weight, 50 pounds per bushel.

Market Price.

HUNGARIAN GRASS. (Panicum germanicum.) A valuable forage plant. Succeeds well on dry. light soil; withstands the drought remarkably well, remaining green when other vegetation is parched up; and if its development is arrested by dry weather, the least rain will restore it to vigor. Sow broadcast at the rate of thirty to forty pounds to the acre, and cultivate the same as Millet. Weight, 48 lbs. per bushel.

Market Price.

RED TOP. (Agrostis vulgaris.) A valuable grass for moist soils. It is permanent, standing our climate well, and consequently well suited for pastures, in which it should be fed close, for if allowed to grow up to seed, the cattle refuse it. On moist, rich soil it will grow two feet, and on poor, gravelly soil, about half the height. Sow twenty pounds per acre. Weight, 14 lbs. per bushel.

Price Variable.

ORCHARD GRASS, OR ROUGH COCKSFOOT. (Dactylis Glomerata.) This is one of the most valuable and widely known of all pasture grasses, coming earlier in the spring, and remaining later in autumn than any other; it grows about two and a half feet high, producing an immense quantity of leaves and foliage. It is well adapted for sowing under trees or orchards, and valuable either for grazing or, if cut when in bloom, for hay. Sow fifteen to twenty-five pounds to the acre. Weight, 14 lbs. per bushel.

Price Variable.

KENTUCKY BLUE GRASS. (Poa pratensis.) This is known in some sections as "Green Meadow Grass," and "June Grass," but should not be confounded with "Poa compressa," which is the true "June Grass." It is the best pasturage for our climate and soil, succeeding finely on uplands, producing the most nourishing food for cattle, retaining its quality to a late period in winter, and farther south affording abundant food throughout the winter. In combination with Red Top, White and Alsyke Clover, it forms the finest and closest pasture. For this purpose an extra quantity of seed should be used—say one bushel of Blue Grass, one bushel of Red Top, and two pounds each of White and Alsyke Clover per acre. Sow early in the spring or during the month of October or November. Weight, 14 lbs. per bushel.

Fancy Clean Seed, Market Price.

ITALIAN RYE GRASS. (Lolium Italicum.) This variety is similar to the English Rye Grass. It is very nutritious and valuable for pastures, especially for early sheep feeding. Sow about two bushels to the acre. Weight, 24 lbs. per bushel.

Per Bushel, Variable; 1b. 10c.

GRASS SEED.—Continued.

PERENNIAL RYE GRASS. (Lolium perenne.) A very nutritious and valuable grass for meadows and permanent pastures. It is also well adapted for sowing under trees where it makes a good lawn, better in fact than any other grass we know. Use I to I I-2 bushels per acre, and under trees I pound to IO by I5 feet. Weight, 24 lbs. per bushel. Price per bushel, variable; per lb., I5c; IO lbs., \$1.00.

MEADOW FESCUE—TRUE ENGLISH BLUE GRASS. (Festuca pratensis.) One of the most valuable pasture grasses. Its long and tender leaves are much relished by stock of all kinds. It succeeds well, even in poor soil, and as its roots penetrate the earth, twelve or fifteen inches, it is not affected except by exceedingly dry weather, and is as valuable a fertilizer as Red Clover. When cured like timothy, it yields a very superior quality of hay. Notwith-standing its acknowledged merits, this grass has only been sown to a limited extent in this country. It is deserving of much more attention than it has hitherto received from American farmers. Sow in spring or fall at the rate of thirty to forty pounds per acre. Weight, 24 lbs. per bushel.

Choice Seed, True Meadow Fescue. Per Bushel, Variable; 1b. 15c.

TRUE PERENNIAL SWEET VERNAL GRASS. (Anthoxanthum odoratum.) This grass yields but a moderate percentage of herbage. It is remarkable for giving out a pleasant, sweet smell during the process of drying, and it is to the presence of this grass that hay from natural meadows owes its peculiar fragrance. Permanent pastures should not be sown without a portion of this grass, particularly in parks and pleasure grounds, if for no other reason than for the pleasant scent which it yields, not only when cut for hay, but also when the seed becomes nearly ripe. Sow twenty-five to thirty pounds to the acre. Weight, 10 lbs. per bushel.

True Perennial, per 1b., \$1.00.

MIXTURE OF GRASS AND CLOVER SEED FOR PERMANENT PASTURES. This mixture is composed of a suitable selection of natural grasses and clovers best adapted for permanent pasture, and the kinds, as well as the qualities, are regulated according to the nature of the soil, situation and purpose for which they are sown. When ordering, please state whether soil is light, medium or heavy. It will take from two to three bushels to sow one acre. Weight, 16 lbs. per bushel.

Per Bushel, \$2.50,

TREE SEEDS.

Seeds of trees and shrubs often fail to germinate well. This is in part owing to their peculiar nature, which requires careful study and treatment. They should always be protected by partially shading the ground where the seeds are sown. The neglect of this is the cause of many failures. A slight shading of brushwood or cornstalks, or any other convenient material, should be placed so as to partially exclude the sun's rays until the plants are well started. Another important matter is early sowing. Many species remain in the ground a whole year, and then germinate. Therefore a careful examination should be made to ascertain the condition of such seeds as have failed to come up when expected, and have been condemned as worthless. We do not keep forest tree seeds in stock, not having sufficient call for them, but can furnish all varieties on short notice. The following we have in stock and quote as follows:

Per Bu.	Lb.	Oz.	Per Bu.	Lb.	Oz.

Pear	1 50	15	Norway Spruce	1 00	10

Culture and Care of Flowers

N OUR List of Flower Seeds will be found all those varieties known to be desirable and worthy the attention of florists and amateurs. Our Catalogue is arranged with a view to aid our patrons in their selection by offering the very best varieties of each species, and to avoid the confusion attending the selection from catalogues in which the greatest possible number of varieties are presented, regardless of their value, many of which only disappoint the cultivator by taking time and garden space which might otherwise be used in growing better flowers.

With patience and the exercise of reasonable judgment, anyone may soon acquire experience Success. enough to successfully grow most of the species of flowers; failure more often results from ignorance and neglect than from any fault of the seeds or of nature. CONSTANT CARE IS REQUIRED in any event.

A few suggestions may prove of value to those who are unfamiliar with floriculture. The selection of the seeds, the preparation of the flower-beds or borders, the choice of location best suited to each species, the use of fertilizers, the time and manner of sowing seeds or of setting plants, the destruction of noxious weeds and injurious insects, and many other details incident to the cultivation of a flower garden-each of which require care and more or less skill.

is the first requisite. We spare no pains or expense to procure the VERY BEST. A Reliable Seed thorough trial of our seeds will do more to establish this fact in the minds of our patrons than any statement made by us would be likely to do.

The seeds of some of the species are very small and delicate, and from many Causes of Failure. causes are liable to fail, particularly when sown in the open ground. If SOWN TOO EARLY, the earth lacks the warmth necessary to insure germination; IF COVERED TOO DEEPLY, the delicate sprouts cannot force their way through; IF HEAVY RAINS ENSUE, the seeds may be entirely washed away or the soil beaten down and crusted over, or perhaps left in such a wet condition as to cause the seed to decay. Again, the sowing may be followed by EXTREME HEAT AND DROUGHT, and if the seeds have started to germinate, the germs are liable to become dry again, in which case they are utterly ruined.

to Sow.

The first of May is early enough, in this latitude, to sow most of the species in the open When and flow ground; too early sowing is a great mistake. The small and delicate seeds must be covered VERY LIGHTLY with earth; the finest of them had better be sown WITH-OUT ANY COVERING, the simple pressure of a smooth board being sufficient. Repeated

experiments with various kinds of delicate seeds, induces us to advise in addition, the covering of such seeds with sheets of newspaper until they are through the ground, thereby preventing the surface evaporation, which so often causes failure, besides protecting the seeds from being forced into the ground so deeply through careless watering, that they could not sprout. By following this method many seeds, that are rather difficult to start may be quite successfully grown. The larger and more hardy seeds may be planted deeper and some of them earlier. It is a safe rule to sow most seeds to a depth of FOUR OR FIVE TIMES THE DIAMETER of the seed itself

A rather light sandy loam suits most flowers, and, in such soils, seeds generally germinate well. Location. Some flowers thrive best in a rather shady situation and in rather heavy clay soils, (the Pansy is a notable instance), while others do best upon light, poor soils, and exposed to the full rays of the sun; this is particularly true of the Portulaca.

The seeds of nearly all the annual varieties, and many of the biennials and perennials, Early Sowing. may be sown in March or April, under glass frames, in greenhouses, or in small boxes in any sunny window. In this way a good stock of plants may be had at small expense, and a gain of several weeks made in the season of blooming; less weeding of the flower-beds will be necessary; and, when the plants are set out of doors, further transplanting is not required. Shallow boxes, two or three inches deep, and with open seams at the bottom, are the best in which to start the seeds. Fill these boxes to within half an inch of the top with good rich soil, mixed with about one-fourth sand; or, if convenient, procure some fine leaf mould from the woods. Make the surface level and smooth, and upon this scatter the seed sparingly. Use a fine sieve, with which sift carefully over the seeds just enough earth to cover them. Afterwards gently shower them with tepid water, using a fine sprinkler, and keep the boxes in a temperature as near 60° as possible. Avoid much watering unless the surface of the soil appears dry. Transplant into other boxes when the plants are large enough to handle, setting them from half an inch to an inch apart. Sometimes the young seedlings are attacked by a minute fungus, which causes them to "damp off." In such a case no time is to be lost in transplanting into other boxes. In setting plants out into the beds or borders, allow a liberal space for each; crowding too many into a small area is a mistake very often made.

Most of the biennials and perennials may be sown late in the summer, from the middle Late Sowing. of August through September, and they will then bloom the following season. When cold weather sets in, about the only protection necessary for the young plants, is a covering of leaves, straw or litter to a depth of three or four inches, and a board on top to keep it in place. They should be uncovered soon after the middle of March.

Fertilizing with Pure Bone Dast.

For fertilizers use well-decayed stable manure, made very fine and well mixed into the soil, or some first-class commercial fertilizer. From an experience of several years we confidently recommend for general use PURE RAW BONE DUST; as a

fertilizer for all plants we have not found anything better; it is more permanent than stable manure, and has the additional advantage of never introducing seeds of weeds By its use the foliage of plants soon acquires a rich green color, and many claim that it imparts a brighter hue to the flowers of many species. It should be applied at the time of sowing or of transplanting to gain the best results.

Annuals, Biennials. Perennials.

Flowers are classified as Annuals, Biennials and Perennials. Annuals are those plants that bloom the first year from seed, and, after ripening their seeds, perish the same season. They comprise many of the most beautiful flowers and, as a rule, are of easy culture. Some of the Biennials and Perennials will flower the first season if the seed is sown early, and they may

then be kept over for another year or longer. Pansy, Snapdragon, Pinks, etc., belong to this class. Biennials bloom the second year from planting the seed, and then die. Perennials, as a rule, bloom the second year, and are more or less permanent thereafter. The seeds of some of the Perennials remain a long time in the soil before germinating. Several species of the Biennials and Perennials will succeed well if the seeds are sown in early autumn.

GENERAL LIST OF FLOWER SEEDS.

Suggestions.

LOWER SE

LOWER SEEDS may be ordered by the Number given to each kind, thereby saving much writing.

We would particularly draw the attention of customers desiring information regarding the CULTURE and CARE of Flowers to the page opposite the preceeding one.

Our Flower Seeds are grown for us in SEPARATE COLORS, and are mixed by us in proper proportions, so that these Mixtures will be found to contain a very choice collection of colors and varieties.

From year to year we will add new varieties of Flower Seeds to our Collection, a list of which will be found immediately following the General List.

We pay Postage on Flower Seeds in Packets.

ABRONIA. (Abronie.)

Trailing plants, with sweet-scented, verbenalike flowers. Remove the husks before sowing, and start under glass. They succeed best in a light, rich soil. Annuals.

NO. PKT.

1. UMBELLATA. Rosy lilac; ½ ft...... .05
ACONITUM. (Eisenhut.)

Popular perennials, with panicles of blue helmet-shaped flowers.

2. NAPELLUS. Monk's Hood; 4 ft..... .05

ACROCLINIUM. (Acroclinium.)

One of the most beautiful and valuable of the everlasting flowers and grown extensively for winter bouquets. Sow in hot-beds and transplant. Annuals.

ADONIS. (Adonis.)

Handsome plants, with showy flowers, and of easy culture in any soil. Seed should be sown early. Annuals.

AGERATUM. (Leberbalsam.)

Fine plants for massing outside, and valuable for winter blooming in the house. Prized by the florists for cut flowers. Annuals.

AGROSTEMMA. (Lichtnelke.)
Attractive, free-flowering plants of easy culture; fine for beds or borders, and an excellent cut flower.

ALONSOA. (Mask-Flower.) (Alonzoa.)

Very ornamental, either in the greenhouse or outside in summer. Very desirable in the garden for the brilliancy of their flowers. Succeeds in any light, rich soil. Annual.

ALYSSUM. (Steinkraut.)

Free-flowering plants, suitable for beds, borders or rock work. Grow well in any rich garden-loam.

NO. PKT.

Graceful ornamental foliage plants, producing a striking effect in the flower garden. Sow the seeds early, and set out last of May, or in June, in rich soil. Annual.

Crimson; 3 ft.....

.05

Pretty annuals, producing white everlasting flowers. Sow the seed the last of May in the open border. They do well in almost any situation.

121. PLATYCENTRA. (Cigar Plant.) Ten-
der perennial
Mr.
CRI AM
A MARIANA

CYCLAMEN. (Erdscheibe, Alpenveilchen.)

One of the most popular plants for winter and oring blooming. The foliage is beautifully spring blooming. The foliage is beautifully marked, and the flowers are extremely handsome. Sow the seed in a compost of well-rotted manure, leaf-mould and coarse sand, thoroughly mixed, and they will make flowering bulbs in one year, if well grown. They require gentle heat and even temperature.

122. PERSICUM. Prize stock; extra mixed; superb strain of very large and richcolored flowers

CYPRESS-VINE. (Ipomea.) (Quamoclit.)

A popular climbing plant with delicate, fernlike foliage, and beautiful, star-shaped flowers. Annual; 10 feet.
123. CYPRESS VINE. Scarlet
124. CYPRESS VINE. White

.05 125. CYPRESS VINE. Mixed; 1/4 oz. 10c; oz. 40c

This favorite fall flower, to succeed well, should have a strong, deep and rich soil. The roots should be stored during the winter in a dry, warm cellar, and covered with sand. If the seed is started very early in a hotbed, and transplanted in May, the plants usually bloom the first year. Half hardy perennials.

126. EXTRA FINE DOUBLE MIXED. Saved

from very choicest varieties...... 127. SINGLE MIXED. From finest varie-

ties. Single Dahlias will flower the first season from seed. The roots are lifted, and wintered over the same as the double.....

DAISY. (Bellis Perennis.) (Tausendschoen.)

Well-known perennials. Admirably adapted for making edgings to borders, and growing in pots. They grow best in a shady and rather cool situation, in loamy soil richly manured.

NO.	PK	T.

PANSY. (Heartsease, Viola Tricolor.) (Stiefmuetterchen.)

This popular favorite is too well known to need description. We spare no pains to get absolutely the best varieties of pansies obtainable. Seed sown in February and March gives better results during the summer and fall than that sown in September, and wintered over. Sow in light soil, and, when large enough, transplant into pots or boxes; and, at the proper time, plant out in the garden in a rich, moist loam, protecting them from winds and mid-day sun. N

allow	them to get dry during hot weather. Per	en-

NO.

SWEET PEAS.

A few lines in regard to the culture of Sweet Peas may not be amiss. Reports of failure to have good flowers are very frequent, but the reason may be almost invariably attributed to our deep sandy soil.

Sweet Peas grow best naturally, where hard-pan is near the surface, or where the soil is more or less clay. The labor and expense of procuring, and making into a bed, a load of clay, is fully repaid by the fine blossoms which otherwise invariably fail to come. By adding a little fertilizer, such a bed may be used for years.

Pure raw bone dust is universally recommended as the best fertilizer for Sweet Peas. A small quantity should be worked into the bottom of the trench in which the peas are planted, but if the soil is moderately rich, it is better to work it into the soil about the plants, after they are up a foot or two; then the plants will produce flowers instead of running to foliage.

If the soil is poor, it should be thoroughly enriched to a depth of one foot before the seeds are planted. If the soil is light, it is advisable to tread it firm before sowing the seed, and thereafter it should not be cultivated much; it is advisable to keep the weeds in check.

The heat often plays havoc with the vines, one day of hot weather parching them to an extreme. Brush is the best support. Some people claim that wire burns the vines when the sun is warm.

Sweet Peas should never be sown near a fence, on account of the lack of ventilation and the additional heat.

In the bottom of a trench six inches deep, sow the seeds, covering them about an inch. As they grow, gradually fill the trench, taking care not to cover the young shoots. Do not allow water to gather in the trenches, but after the plants are well started, they can hardly be watered too much.

We have been informed that a very successful method of cultivating Sweet Peas, to have them flower well in light soil, is to sow the seeds to a depth of eight inches, as soon as it is possible to work the ground, as early as February being recommended. Success has also followed their being sown late in the fall, but at that time to a depth of nine to twelve inches.

The following list contains the large-flowering kinds only, but for the benefit of customers desiring separate colors of energy weeklence, we have designated in black-faced type those sorts which are recognized to be the very best ach color.

DWARF SWEET PEAS.

White Cupid. Suitable for beds or borders, growing about six inches high.

Packet 05c., oz. 10c., 1/4 lb. 40c., lb. \$1.25.

Pink Cupid. A departure from Blanche Ferry, growing 6 to 8 inches high, and spreading 12 to 15 inches around. As easily grown as the tall varieties.

Packet 05c., oz. 15c., 1/4 lb. 40c., lb. \$1.25.

MIXED SWEET PEAS.

Consisting of many different kinds of Sweet Peas grown together, which will be found to be a good mixture for the price.

Oz., 05c., 1/4 lb. 15c., lb. 40c.

EXTRA MIXTURE.

Consists of a mixture of all sorts with a number of the better named sorts added to insure a choice selection of colors. An excellent mixture.

Packet 05c., oz. 10c., 1/4 lb. 20c., lb. 60c.

SUPERB MIXTURE.

This mixture cannot be surpassed by anyone. It is our own best mixture of the large flowering Sweet Peas only, in the above list, embracing all colors with light colors predominating.

Packet 05c., oz. 15c., ½ lb. 35c., lb. \$1.00.

EVER-BLOOMING FRENCH CANNAS.

There are but few plants, which can be grown with only a small amount of care and attention that give so much satisfaction, and make so fine a display as a bed of French Cannas.

The old fashioned tall Cannas, that were grown for their foliage, had a place in floriculture, that could not otherwise be filled, but with the improvement made by adding to fine foliage, fine flowers, almost as various in colors as the rainbow, we have a bedding plant that is unsurpassed. The flowers are being constantly improved. New colors are added, and shades are intensified until the list of sorts is numbered by the score.

The latest departure is in the size of the flowers, which have now been increased in a few sorts to

a diameter of over five inches.

We give a list of tested varieties which may be depended upon as the choicest of many that are usually catalogued.

Our plants have been grown in pots and are large enough to be kept in the house if desired, where

they also make a fine show, or they may be bedded, providing the danger from frosts is r	ast. Each.	Doz.	
Mrs. Kate Gray. The foliage is very luxuriant, plant vigorous, growing about 3 feet high, and the flower is immense in size, of a clear wine color suffused with gold and in spite of its great size has a good deal of substance		\$2 00	
Pennsylvania. Height 5 to 6 ft. Color pure deep scarlet and bears the largest flowers that grow on any Canna. Very showy and attractive	50	5 00	0
Black Beauty. This is a foliage Canna only, but the finest, darkest Canna grown; grows 5 to 6 feet high and is a deep bronze, almost black; excellent for a center or background for dwarfer sorts		. 2 00)
Madam Berat. Dark carmine pink. Color is quite distinct and attractive. Good trusses about 4½ feet high	. 10	1 00)
Martha Washington. A genuine rose-pink in color; very free flowering and grows about 3 ft. high	20 .	2 00)
Cloriosa. Practically a dwarf Queen Charlotte with larger flowers, 2 to 3 ft	20 .	2 00	ŀ
Italia. One of the new monster-flowering Cannas. Flowers may be described as having large splashes of bright red on canary-yellow ground. Grows 5 or 6 feet high and is very vigorous; flower stalks large and carried well above the foliage, which is strong and tough	10	1 00	
afternoon sun	10	1 00	,
Burbank. Like Austria, but has more prominent spots. Foliage very strong and tough; plant sturdy and vigorous, producing large flower stalks well above the foliage	10	1 00	
President Cleveland. (New.) Originated on the grounds of the White House. The grandest scarlet Canna to date. Grows four to five feet high, and bears immense clusters of brilliant orange scarlet flowers. Flowers 4½ to 5 inches			
across	10	1 00	2
Duke of Marlborough. Color crimson maroon; very distinct. A fine bedding canna	10	1 00	
Beauty Potevine. Bright rich crimson. Endures heat and drought without fading and grows about 3½ feet high	10	1 00	
large flowers. A strong grower and fine for large beds or for a center plant. Five to six feet.	10	1 00	1
Souvenir Antoine Crozy. The finest of the gilt-edged type. Plant grows 2½ to			
3 feet high. Flowers intense scarlet, bordered with a broad band of gold. Does not fade with heat. and makes a striking appearance Egandale. Bronze leaves and large clusters of cherry-red flowers; 4½ ft	10 10	1 00 1 00	
Tarrytown. Bright cherry-red; very rank grower and stands the sun remarkably well; $3\frac{1}{2}$ ft	10	1 00	

CANNAS .- Continued.

Florence Vaughan. An old sort, but deservedly retains its popularity. Height Each. 4 to 5 feet; habit vigorous, producing many strong stalks, bearing large spikes of brilliant flowers which are bright yellow, covered with large bright red spots. The best of this type	Doz.
Chas. Henderson. Brilliant crimson. Height 3 to 4 feet. Foliage dark green. The best of the older and cheaper Cannas for bedding. Being a strong grower and having large flower stalks, a bed of them is a glow of color all summer. 10	1 00
Madame Crozy. Almost the first of the French Cannas. Height two feet. Habit vigorous; flower spike large; color bright crimson, edged with gold. Profuse bloomer, and makes a fine pot plant\$0 10	\$ 1 00
Queen Charlotte. One of the first of the gilt-edged type. Similar in color to Madame Crozy, but having a broad band of yellow; might be described as being yellow, with a large red blotch. Habit good, but fades a little in the sun. Height 3 to 4 feet	1 00
L. E. Bally. A vigorous strong-growing Canna, producing large, canary-yellow flowers, very faintly mottled with red. Height 4 to 5 feet	1 00
Alphonse Bouvier. A standard Canna, having brilliant scarlet flowers. Height 4 to 5 feet. Spikes large and drooping. Planted extensively and very popular 10	1 00
Ed Mieg. A strong, sturdy grower. Height $3\frac{1}{2}$ to 4 feet. Bears large trusses of vermillion scarlet flowers. Very bright and conspicuous in a bed 10	1 00
Gigantea Discolor. This is the strongest, tallest foliage Canna grown. Will attain a height of 8 to 10 feet, with strong leaves nearly a foot broad, green and so heavily veined and ribbed with bronze as to pass for a bronze-leaved Canna. Just the thing to hide an unsightly fence or to make a dense	
background or screen	1 00 50
Common Tall Green Cannas. Grown for foliage. Dry roots 05 Common Tall Bronze Cannas. For their foliage. Dry roots 05	50 50

CALADIUM ESCULENTUM.

Caladium Esculentum.

Commonly called Elephant's Ears. One of the most beautiful and ornamental foliage plants, either for pot culture or the open ground. They have broad, light green leaves, beautifully veined with dark green, and will grow to immense size if well taken care of. We have ourselves grown the plants five and one-half feet high, with leaves forty-four inches long. The small bulbs make a fine border for a bed of Cannas, and as they grow well in the shade, are unequalled to plant in the angle between the piazza and the house. The large plants are planted singly in lawns, and make a fine tropical appearance. To grow them successfully, the soil should be rich to a depth of two feet, and if the plants are watered plentifully (they cannot be watered too much) and an occasional dressing of fresh cow manure applied, they will make a growth that is really wonderful.

GLADIOLI.

Of summer blooming plants for general garden decoration the gladiolus is deserving of special attention. Requiring but little room, they are exceedingly useful for filling vacant places, while for massing in large beds, where a brilliant and effective display is desired, they are invaluable. They succeed best in good loam, enriched with well-rotted manure. The bulbs should be planted about three inches deep and six inches apart, and kept well watered.

Gladioli in Separate Colors.

This list is composed of a selection of different sorts of the same shade or color, and is given for those who have a stock of bulbs but are short of certain colors.

LILIES.—(Lilium.)

Lilies will thrive the best in a rich, dry soil, where water will not stand in winter. After planting they require very little care, and should not be disturbed for years, as established plants bloom more freely than if taken up annually.

In this list we offer only such varieties as can be safely set in the spring.

For other varieties see catalogue of bulbs for fall planting.

Lilium Aratum.

Auratum. (Gold Banded Lily.) This magnificent variety has become one of the standard favorites of the flower garden. The blooms measuring nearly six inches in width when fully expanded; are produced in great profusion; very fragrant. Imported from Japan....... \$0 20

tint on ends of the petals 20

15

15

Superbum. Yellowish-red flowers, from twenty to fifty in number, in the form of a pyramid.....

Tigrinum, fl. pl. (Double Tiger Lily.) Bright orange scarlet, with dark spots; a strong-growing, showy variety, and entirely hardy; succeeds well everywhere......

Postage on Roots and Bulbs, One Cent for Two Ounces.

TUBEROSE.

A white, sweet-scented flower, too common to need much description. The bulbs grow in any garden soil, but should be planted where the sun can reach them all day, if possible. They may be started in pots in the house, but being very tender should not be set out until the weather is quite warm, usually about the middle of May. It is important that the small bulbs be broken from the main one.

Double Pearl. First size and quality.......3c. each; 25c. per doz.; \$1.50 per hundred.

IRIS KAEMPFERII.

Called Fleur d'Lis and Japan Iris. One of the most beautiful varieties of the Iris family. The colors are blue, purple, red or white. Some of the varieties are clear colors; others with yellow spots at the base of the petals, and others beautifully mottled, striped and variegated. They need the sun, grow in any garden soil, and in a few years spread to a width of two feet, when the clumps should be divided.

Mixed Colors.	 \$0 15
	Each.

Herbaceous Pæonies. These paeonies are among the showiest and most useful of hardy plants, growing well in almost any situation or soil; the flowers will be finer and colors brighter if planted in deep, rich loam, well manured.

Dutchman's Pipe.—(Aristolochia Sipho.) A hardy vine with large heart-shaped leaves and brownish flowers resembling a miniature pipe. Excellent where a dense shade is wanted. Being slow to root, the vines do not make much growth the first season, but are well worth waiting for. Strong dormant plants\$0 35

Cinnamon Vine. A`fine, hardy climber, known also as Chinese Yam. Beautiful glossy leaves, with prominent veins; flowers sweet-scented.................\$0 10 \$0.75

Pyrethrum Roseum. Variously known as Single Asters and Summer Chrysanthemums. Is a new flower, ranging in color through various shades of red and pink to pure white, and come single, semi-double and double. The plant grows about 18 inches high and is perfectly hardy. These we offer have been grown in pots and should bloom in June, and if they are cut off at the ground after they have bloomed, they will blossom again in the fall. They last a long time after being cut, and wherever shown, have been much admired. Per dozen, \$1.00. Each...........\$0 10

VEGETABLE PLANTS.

We shall have a full supply of the best varieties of Cabbage, Cauliflower, Tomato, Egg Plant and Pepper Plants at the proper season. Well grown plants, raised from our own seeds, at low prices.

Postage on Roots and Bulbs, One Cent for Two Ounces,

MATTHEWS' NEW UNIVERSAL GARDEN DRILL, EACH, \$6.50; BOXED, F. O. B., CLEVELAND, O.

Matthews' New Universal Dill and Drill Seeder. A A

Will sow continuously or drop seeds in hills any distance apart up to four feet. PRICE, BOXED, F. O. B, CLEVELAND, \$7.25.

Seed attachments, markers, cut off, etc., are the same as the Garden Drill, but has two wheels, which, when used as a cultivator enable one to straddle the row. Can also be used with a single PRICE COMPLETE, BOXED, \$8.50, F. O. B., CLEVELAND, OHIO. wheel.

THIS drill has been built to meet the demand of the small gardener, whose sowings are not extensive enough to warrant the buying of high priced machine. The "Little Gem" dces the work as well as any machine made, and costs much less. It will sow anything from beans to cabbage seed. Opens the row, drops the seed regularly, covers and rolls and marks the next row.

PRICE BOXED, F. O. B. CLEVELAND, \$5.00.

NEW UNIVERSAL EXPANSION WHEEL HOE, CULTIVATOR, RAKE and PLOW.

The "expansion" part of this cultivator enables one to cultivate to a greater width than the regular cultivators. The "arch" is higher, also, so that taller plants may be worked without injury. Otherwise this machine with its attachments is like the "Double Wheel" machine.

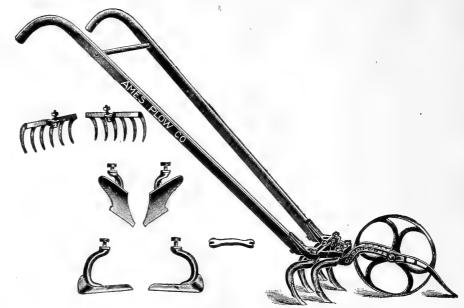

Price, boxed, f. o. b., Cleveland, \$6.50.

MATTHEWS' SEED DRILLS AT REDUCED PRICES.

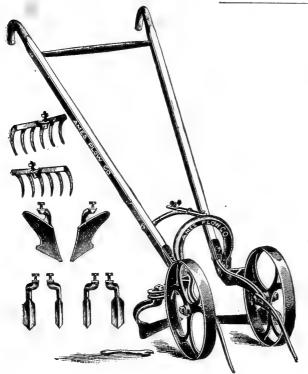

We have on hand a few of the old style, wooden frame Matthews' Combined Drills, which we offer at a price that ought to sell them to anyone that has any use for a drill. There are hundreds in use that give perfect satisfaction. The former price on them was \$7.50. They were never sold for less. Special price while they last \$4.00 each.

New Universal Single Wheel Hoe, Cultivator, Rake and Plow.

This is also an improvement over other tools of this type. It can be used either between or astride the rows, although it is really intended for between row cultivation. For straddle cultivation the wheel can be set to one side so as to bring the row of young plants under center of frame. The adjustment for graduating the depth of cultivation is unique and readily accomplished.

Price, boxed and delivered at Depot or Express Office, Cleveland, O., \$4.50.

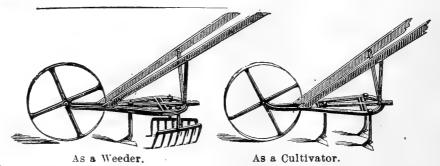

NEW UNIVERSAL DOUBLE WHEEL HOE and CULTIVATOR, RAKE and PLOW.

Specially designed for working both sides of the row at one passing.

This new hand implement embraces all the good points of older efforts in the same line, and in addition offers new features which cannot fail to be appreciated. The special recommendation is the adjustable arch which by an ingenious device enables the teeth to be pitched at any angle desired.

Price, boxed and delivered at Depot or Express Office, Cleveland, O., \$5.25.

COMSTOCK'S HAND CULTIVATOR and ONION WEEDER.

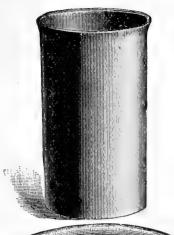

These implements are all metal but the handles; light, neat and durable, and are made to a standard, so that any of the parts can be duplicated. They will prove all that is claimed for them.

Both Implements Combined, \$4.00.

INDURATED FIBRE WARE.

This article is a great improvement over the old fashioned earthen ware, tin or porcelain, because it is waterproof, light, not easily broken, cheap, cannot rust, and is almost indestructible.

The vases are used by the best florists and are far superior to anything else for displaying and keeping cut flowers. The new size for roses and 'mums will fill a long felt want.

These larger sizes, (16, 18 and 20 inch) are very heavy, and will carry safely 200 lbs.

Columbia Flower Tubs.

These tubs are made of the best cypress timber, which will keep for years without rotting. They are made of twelve staves, in tapered shape, held together by two heavy steel wires, which are connected with substantial iron handles, and are so arranged that the wire can be tightened or loosened by simply turning nut on handle.

LANG'S WEEDER.

PRICE, 25 CENTS.

WARD'S WEEDER.

The most useful Weeder made. Made of the best steel plate, having saw edges; no one should be without it.

Price, 30 Cents Each.

EXCELSIOR WEEDER.

A very useful implement for eradicating weeds when first starting into growth, but more especially useful (in our experience) for loosening the soil in flower beds where a large tool could not be used. It is made in imitation of the hand, with five fingers. In operating, it is used in the left hand to loosen the soil, while the right hand is free to pull up the weeds by the roots.

Price, 10 Cents Each.

YOU NEEDN'T BREAK YOUR BACK WITH A

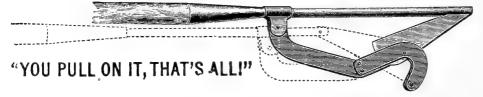

EACH

50c.

The only practical device on the market.

THE "LITTLE GIANT" TREE PRUNER.

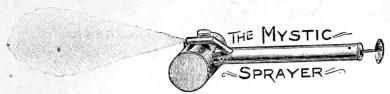

\$2.00.

RAFFIA.

Excellent for tying celery, asparagus, trees, shrubs, etc. Strong and cheap.....Per lb., 25 cents

Sprayers, Syringes, Etc.

MYSTIC SPRAYER. Brass tank and tube, tin barrel. So far as we have been able to learn, this is the best atomizer yet made. It throws the spray farthest and can hardly be bettered at any price. It

is being used by the City Health Officers and by physicians generally for spraying disinfectants, as well as by many people to rid plants and shrubs of insects and fungi. List of insecticides on last page. Price, each, \$1.00.

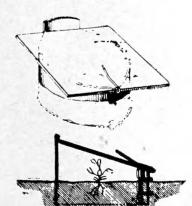

We carry a line of various Brass Syringes which are useful in greenhouses and gardens, and being made of extra heavy material are very durable. They come in different sizes from 7½ inches to 18 inches long and from 1 inch to 1¾ inches in diameter. Prices each from \$1.00 to \$8.50

Hydrosprayer, a very large Brass Syringe	\$5	00
Cyclone Nozzle for the Hydrosprayer	1	00

"KROPKOLLAR."

When late frosts are threatening or cut-worms appear, think or "KROPKOLLAR."

A "Kropkollar" is a piece of fibre-board from three to six inches wide, bent around a plant, pressed into the ground about two inches, and held together with a wire fastener.

It is an Absolute Preventative Against Cut-Worms.

By setting the Kropkollar with the short side to the south and putting in place a pane of glass, we have also a small cold-frame for starting plants early.

There is also a fibre cover, which comes with a Kropkollar, which will keep out the frosts that sometimes come in May and work such damage to early vegetables and flowers.

In our opinion, this contrivance is a practical device for which there has been absolute need for years.

Price of Kropkollar, cover, glass and fastener complete, 7c each, 75c per doz., \$6.00 per 100

INSECTICIDES.

Hammond's Slug Shot. Recommended for most worms and caterpillars which infest cabbage plants, currants, gooseberries and the like. 5 lb package, 30 cents; 100 lbs., \$5.00.

White Helebore. Effective for slugs on pear and other trees, currant and cabbage worms, etc. 1/4 lb., 10 cents; 1/2 lb., 18 cents; 1 lb., 30 cents.

Paris Green. Strictly pure. Price variable.

Persian Insect Powder. Strictly fresh. Kills flies, mosquitoes, roaches, ants, etc. Lb., 50 cents.

Whale Oil Soap. Prevents the ravages of mealy bug and various kinds of worms and insects that infest the bark of trees and shrubs. Per lb. package, 20 cents.

Stott's Fir Tree Oil Soap. A superior remedy for a great many insects that attack house plants, particularly for plant lice; in our experience it is the only article that really kills them and that can be used without inconvenience in the house. For ridding palms, rubber trees, geraniums, and any kind of house plant of insect enemies it has no equal. It is not offensive, may be applied with a syringe or brush, and is cheap. One ounce makes one gallon.

Price per ½ lb. can, 25 cents.

Tobacco Dust. Fertilizer and insecticide An excellent fertilizer for lawns and gardens, and a good preventative against cut worms and leaf-eating caterpillars. Dust on to the plants when they are wet, and for cut worms spread on the ground around the plants to be protected.

Per lb., 05c.; 25 lbs., \$1.00.

Bordeaux Mixture. The most reliable preventative for spraying vineyards and orchards in general against all fungus diseases. With Paris Green added, it is the only remedy used with success. One quart makes fifty quarts of liquid ready to apply. Per quart, 50c.

FERTILIZERS.

PURE RAW BONE DUST. There are many Commercial Fertilizers offered in the market of more or less merit, but, as is well known, it is difficult to determine which possesses the most value. We believe, however, that Pure Raw Bone Dust is recognized as the Best Fertilizer for enriching lawns, gardens, vineyards, or, indeed, any place where enriching the soil is desired, for which it cannot be surpassed. It brings no weeds, no filthy stench and is easily applied, while its effects are, beyond all others, very lasting.

Sometimes good results can be obtained by mixing a good Commercial Fertilizer with Pure Raw Bone. While the Commercial will take immediate effect, the Bone acts slower and a better crop may always be expected.

The Bone we offer is strictly pure, ground from raw bone.

Price, per lb., 5c; 25 lbs., \$1.00; 100 lbs., \$3.00; 200-lb. sack, \$5.00.

Larger quantities at special price.

BRADLEY'S ENGLISH LAWN FERTILIZER. This Fertilizer, which is manufactured by the Bradley Fertilizer Co., one of the largest manufacturers of Fertilizers in the country, we do not hesitate to recommend for lawn and garden use.

Price, 25 lbs., \$1.00; 100 lbs., \$3.00; 200 lbs., \$5.50.

PULVERIZED SHEEP FERTILIZER. An excellent natural fertilizer where prompt results are desired. Used largely by the best florists and is safer to use than most chemical fertilizers. In 100 lb. sacks, per sack, \$3.00.

LAND PLASTER.

 Per ton
 \$10 00

 Per Bbl. (250 lbs.)
 1 25

BOWKER'S PLANT FOOD. The success of this article is unquestioned. For enriching the soil in a pot, without injury to the plant it is just the thing needed, and the demand for it speaks well for its effectiveness.

The small package contains enough to enrich thirty plants for three months.

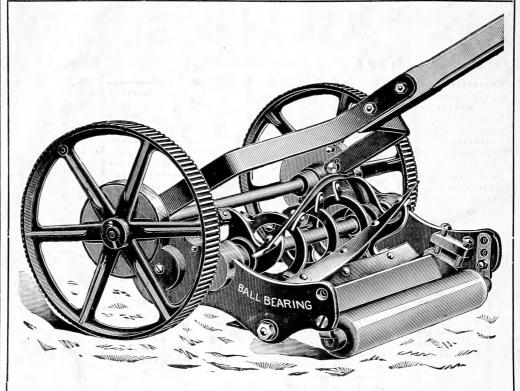

Price, small packages, 15 cents; large packages, 25 cents.
